

AG- ABST Discs

PRINCIPLE

AstraGene - ABST -Discs are used for antimicrobial in-vitro susceptibility testing (ABST) in clinical laboratories to detect drug resistance to staphylococcus aureus

Disc Diffusion method a common technique used for antimicrobial susceptibility testing (ABST) of common rapidly growing bacterial pathogens and sometimes for fastidious species.

PACKAGE CONTENTS

50 test kit contains 50 discs packed with a desiccant envelope.

SUSCEPTABILITY TEST PROCEDURE

Prepare plates with Mueller Hinton Agar (MUA)& Ready Prepared Plates(Cat.No.AG/MHA/22/01) for use in the Bauer-Kirby Method for rapidly growing aerobic organisms. For fastidious organisms such as Streptococci, the agar (Cat.No.AG/MHSB/22/01) is supplemented with 5% sterile, defibrinated blood. For Haemophilus spp. Haemophilus Test Medium and for N. gonorrhoeae, GC Agar Base with 1% defined growth supplement are recommended respectively. The medium in the plates should be sterile and have a depth of about 4 mm.

PROCEDURE

1.Preparation of plates

Procure/ prepare sterile Muller Hinton Agar (MHA) with 4mm depth. Ensure that there is no moisture on the agar surface for clear interpretation of results.. 5% defibrinated sterile sheep blood should be aseptically added to MHA for testing Streptococci and other fastidious organisms.

2. Inoculum preparation and inoculation

- Use only pure culture for sensitivity testing. Perform Gram staining before preparing an inoculum.
- Select 4 to 5 colonies and transfer them into tube containing 5 ml of Trypticase Soy Broth with the help of a inoculation loop.
- Incubate the broth culture at 35-37 °C for 2- 5 hours to obtain moderate turbidity.
- Dilute the broth culture of actively growing organisms with sterile broth or saline to obtain a turbidity equivalent to that of half density of McFarland Standard No.1 which prepared by adding 0.5 ml of 1.175% BaCl₂ 2H₂O solution to 99.5 ml of 0.36N H₂SO₄. Avoid overnight cultures. Alternately, for the development of a sufficiently turbid broth culture, colonies can be suspended directly into a small volume of saline or broth which is then adjusted upto the turbidity equivalent to half density of McFarland Standard No.1 . Immediately use the standardized inoculum (within 15mins) to prevent further growth.
- Dip a sterile cotton swab into the standardised inoculum, rotate it while pressing against the inside wall of the tube to remove excess inoculum
- Streak the agar surface of the MUA plate in three directions, tuning the plate by 60° between each streaking.
- Keep the inoculated MUA plate for 10 minutes to dry the inoculum. Confluent growth is desirable for accurate results.

3. Application of sensitivity-discs

- Remove one antibiotic sensitivity disc from the vial with the help of sterile forceps and carefully place it on the surface of the medium.
- Finally, press it tightly with the forceps to make complete contact with the surface of the medium.
- Allow the plate to stand at room temperature for 30minutes (pre-diffusion time) before incubation. Incubate the plates at 35-37 °C for 18 hrs – 24hrs.

4. Reading the zone of inhibition

- Measure the diameter of the zone of inhibition at the end of the incubation period.
- Measure only those zones that are showing complete inhibition and record the zone diameter to the nearest millimeter.
- If only isolated colonies grow instead of confluent growth, the inoculum is too light and the test should be repeated.

STORAGE &STABILITY

Store at -20 °C under dry conditions and protected from light immediately upon receipt.

MICROBIOLOGICAL TEST

Refer Annexure 1 for interpretation of susceptibility criteria (zone of inhibition) on Mueller Hinton Agar after 18 hours incubation at 35-37 °C as per CLSI (Clinical Laboratory Standards Institute).

LIMITS

Disc diffusion method use an in-vitro technique and cannot therefore reproduce the extremely in-vivo conditions. Many variable factors influence the final result of the AST. The major factors are : the culture medium used, impregnation of the discs, inoculation of the medium, temperature, time and incubation atmosphere of the plates, pre-incubation and pre diffusion conditions, depth of the medium etc.

PRECAUTION

The Antibiotic Disc cannot be classified as being hazardous according to current legislation but fall within the specific field of application where safety data sheet must be supplied because they can cause phenomena of sensitisation in sensitive subjects if they come into contact with the skin.

Antibiotic discs are disposable products. Antibiotic Disc are only for diagnostic in-vitro use and are intended for professional use. They must be used in the laboratory by properly trained operators using approved aseptic and safety methods for pathogenic agents.
